In Anticoagulant Therapy, the safety and consistent reliability of heparin are now widely appreciated. PULARIN (heparin-Evans) is available in powder form, in solution for intravenous or intramuscular injection and in the form of heparinised tubes. The outstanding advantages of heparin as a therapeutic and prophylactic agent include:

- It is a naturally-occurring substance.
- Minimal laboratory control is required during therapy.
- Potency is expressed in International Units.
- The heparin effect may be immediately suspended by intravenous injection of protamine sulphate.
- Where required, prolonged heparinisation may be obtained by intramuscular injection of concentrated Pularin.
