

# Parenteral vitamins

In the management of acute or chronic renal failure, meticulous attention to fluid balance is of major importance.

For administration, the parenteral route is obligatory and demands precisely measured nutrients for the essential metabolic functions together with an adequate supply of vitamins of the B complex and vitamin C.

*Parentrovite* is a suitable concentrated, potassium-free preparation of aneurine, pyridoxine, nicotinamide, ascorbic acid and a smaller quantity of riboflavine, together with glucose, for adding to the intravenous infusion. For the convalescent phase, consider *Orovite* — a high dosage oral preparation containing the same essential water-soluble vitamins in comparable doses.

These preparations are only two of the many vitamin specialities produced by Vitamins Limited. The Company has been conducting research into, and development of, vitamins for more than 40 years and is now the acknowledged leader in this field. As a result, Vitamins Limited offer an unrivalled range of preparations covering a wide variety of indications.
